Project Title: Hospital Management System (HMS)

Deliverable 3: Development Phase 1: Minimum Viable Product (MVP) for Hospital

Management System

Group Name: Geeky Techs

Group Members:

1. Yaramala Anusha

2. Rangineni Vishwitha

3. Dinesh Reddy Puthalapattu

4. Chenna Reddy Deepak Kumar Reddy

5. Sai Satya Pavan Pandu Vanka

6. Tejaswi Ganjinaboina

7. Chandrupatla Divya Anusha

8. Jaswanth Makala

Introduction:

This phase marks a significant step toward establishing a comprehensive Hospital

Management System (HMS) designed to streamline hospital operations, enhance patient care,

and ensure data security. Our MVP focuses on laying a solid foundation with core

functionalities that address the critical aspects of healthcare management and patient service

delivery.

Requirements:

The core requirements remain consistent, though a minor yet significant change in the

database approach was agreed upon during our initial peer meeting for this deliverable. We'll

detail this change in the corresponding section. Here, we outline the requirements for this

phase:

User Registration and Login:

We have developed model classes for both patients and staff to facilitate their registration

processes, creating database tables to capture their information securely. Registration and

authentication processes are fully encrypted, ensuring no potential breaches in privacy.

Profile Management:

Patients and staff will have distinct profile structures. Patient profiles focus on personal details such as name, email, picture, location, and password. Staff profiles, on the other hand, contain more in-depth information, including contact numbers and professional identifiers. Despite the distinct nature of these profiles, both sets of data are unified an authentication system, ensuring coherence and security.

Appointment Scheduling Interface:

A dedicated module has been introduced to facilitate the scheduling, monitoring, and management of appointments. This is aimed at reducing wait times and improving service delivery efficiency.

Basic Messaging system for patient – provider communication:

The implementation of EHR allows authorized personnel to access patient information in real time, significantly elevating the standard of care provided.

Basic Dashboard for patients and health care providers:

Patient will be having a dashboard which includes the patient profile, patient appointments and book my appointment. Doctor will be having a dashboard which includes profile information and appointment history of patients.

Basic Reporting for Administrative purposes:

SQL queries are used to retrieve data for the reports. These queries should aggregate and filter data as needed based on the reporting requirements. Format the retrieved data appropriately for presentation in the reports. This might involve transforming raw data into tables, charts, or other visualizations.

Basic Search and Filter Functionality for Healthcare Services:

Implement a PHP function to search for healthcare services based on user-entered keywords. Use MySQL to match keywords against service names, descriptions, or other relevant fields in the database. Return matching services as JSON data to be displayed on the frontend

Emergency contact information:

Used AJAX to asynchronously send requests to the server for adding, updating, or deleting contacts without reloading the page. Create forms for users to input and edit emergency contact information.

Display the user's existing emergency contacts and provide options to add, edit, or delete contacts.

User Feedback Submission:

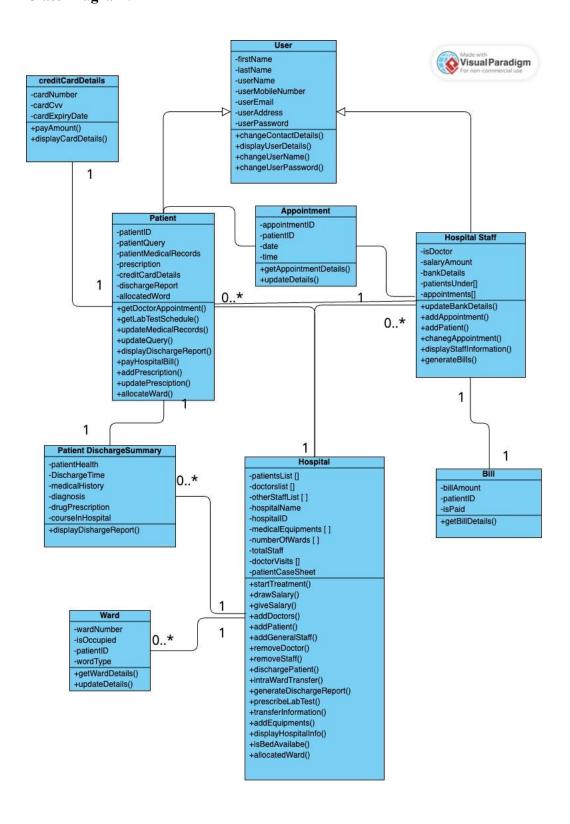

Create a form for users to input their feedback. Provide a text area or input field where users can type their feedback. Optionally, allow users to categorize their feedback (e.g., suggestion, complaint) or attach files.

Mobile Responsiveness for Access from Various Devices:

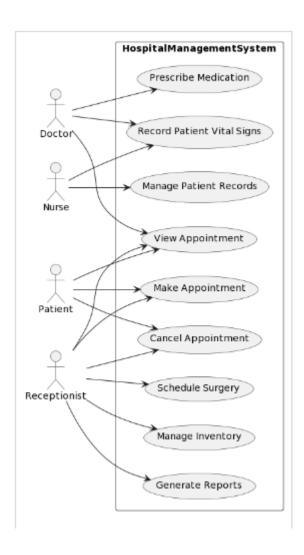

Utilize CSS media queries to apply different styles based on the screen width. Design fluid layouts that adjust dynamically to fit the available screen space. Prioritize content and functionality based on screen size to ensure a smooth user experience across devices.

UML Diagrams:

Class Diagram:

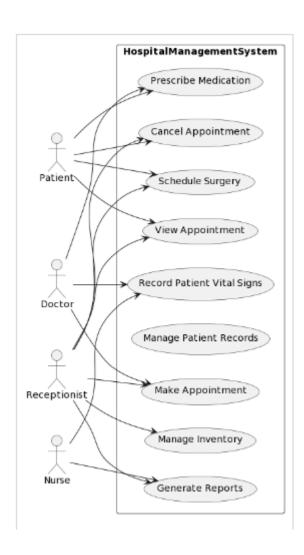

Use Case Diagram:

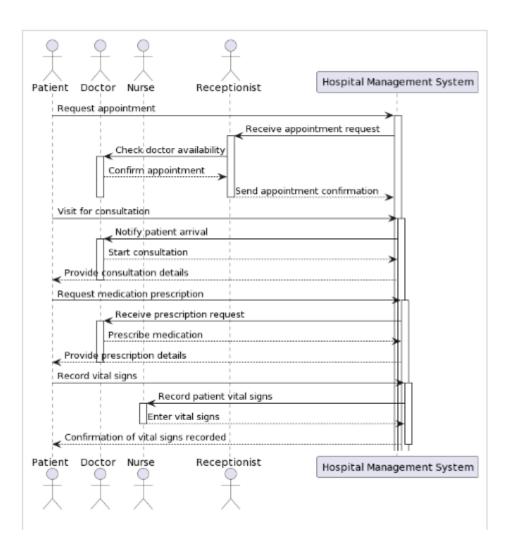

Use Case Error diagram:

In our project patient can't schedule a surgery, and can't prescribe medication and doctor can't make appointment. Nurse can't generate reports. Based on these scenarios we have drawn the use case diagram for error case.

Sequence Diagram:

Test Cases:

Functionality	Input	Output	Expected
Patient Sign Up	Valid Credentials	Successful Signup	Successful Signup
Patient Sign Up	Non-Unique Credentials	Sign-up error	Sign-up error
Login	Wrong Credentials	Error	Credentials Error
Login	Authorized Credentials	Redirect to Patient Dashboard	Redirect to Patient Dashboard
Add Doctor	Input the Doctor's details with some empty fields	Error	A prompt indicating the exact missing fields
Add Doctor	Input the Doctor's details with	Doctor Successfully Added	Doctor Successfully added
Doctor Login	Fill all fields	Successfully product logged in	Doctor successfully logged in
Doctor Login	Fill in invalid credentials	Error	An error indicating either the username or password are invalid
Add Patient	Input the Patient details with some empty fields	Error indicating the missing fields	Error indicating the missing fields
Add Patient	Input the Patient details with all the correct details	A prompt indicating a patient has been successfully added	A prompt indicating a patient has been successfully added

Book	Select	The list of doctors	The list of doctors
appointment	specialization with	will be empty	under that category
	no registered		or specialization to
	doctor		be empty
Book	Select the	A list of doctors	A list of doctors to
Appointment	specialization with	appears.	appear for the
	registered doctors		chose
			specialization
Book	Try to book	Both appointments	An error indicating
Appointment	appointment for	are successfully	that the time
	the same doctor	booked.	allocation is not
	date and time		available.
Reports	Choose previous	A list of patient	A list of patients'
	dates	records appears for	records added
		those added within	within the selected
		the selected period	period
Patient Search	Input random	An output	An output
	search words	indicating no	indicating no
	unrelated to any	records founds for	records founds for
	patient	unrelated search	unrelated search
		words	words
Patient Search	Input random	An output	An output
	search words	indicating the	indicating the
	related to a patient	records founds for	records founds for
		related search	related search
		words	words

Interface Test:

The functionalities of various interfaces were tested. Each interface was checked for proper functioning and appearance. The pages were selected randomly, however, the functionalities of each were tested in detail. These tests were limited to Phase 1 requirements and more detailed tests will be done in the subsequent phases. The images below show various interfaces and the output.

Image 1: The Patient Dashboard

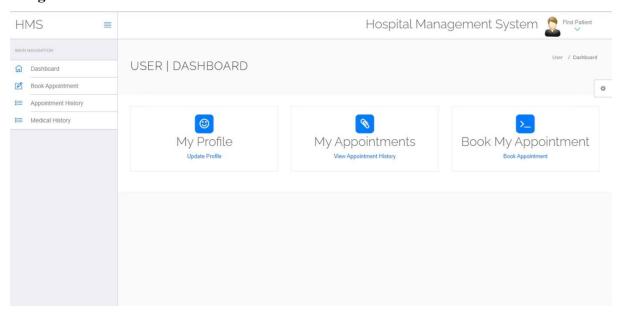

Image 2: The patient registration

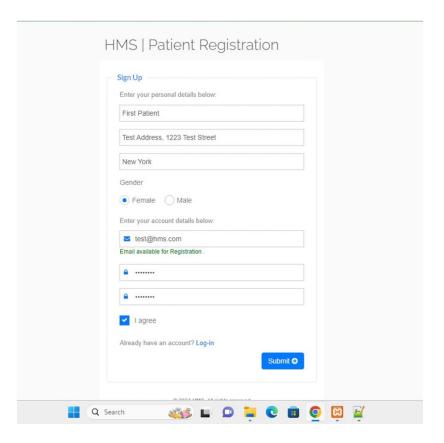

Image 3: The Add Doctor Page

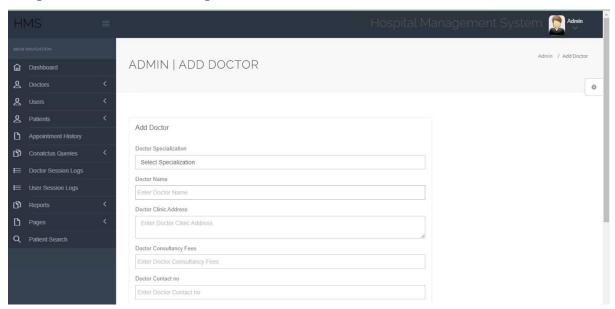

Image 4: The Doctor Dashboard

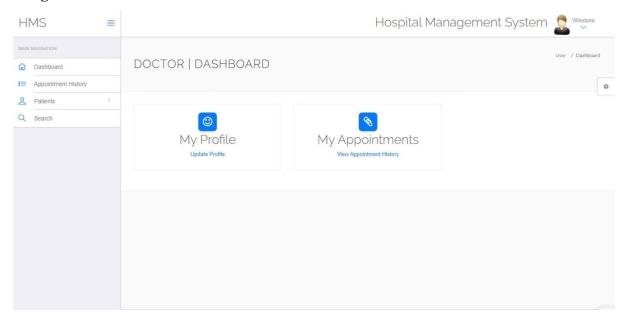

Image 5: The Add Patient Page

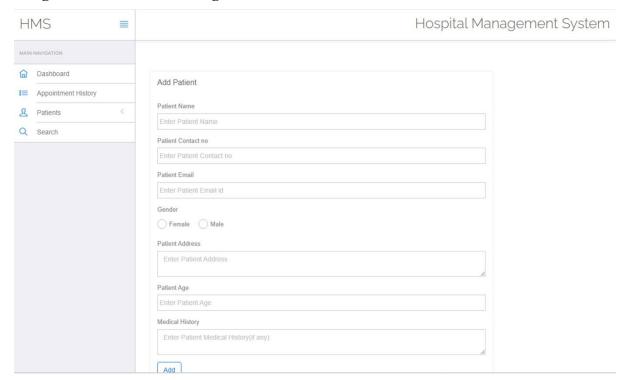

Image 6: The Book Appointment Interface

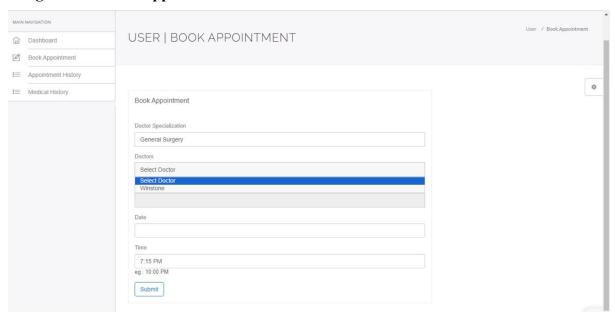

Image 7: An example of an alert

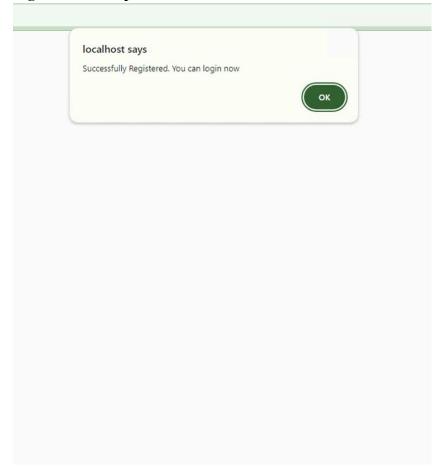

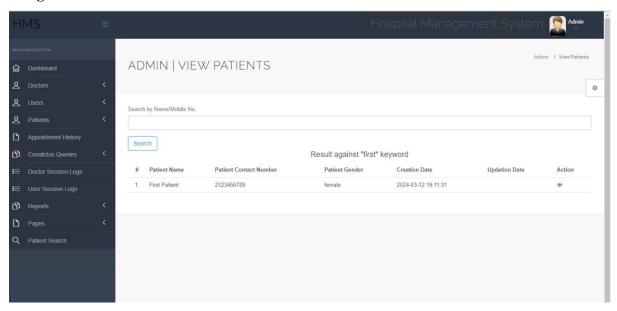

Image 8: The Admin Panel – View Patients Interface

User Manual:

How to Use the Program.

General:

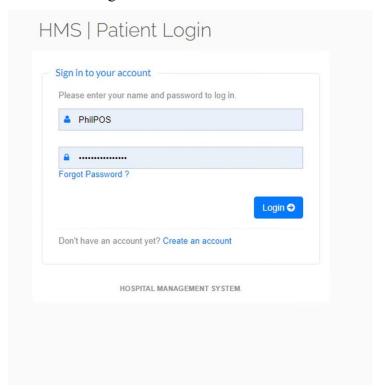

Every user interacting with the Hospital Management System must have an account with unique credentials. These include a unique username or email address and a unique password. The Admin creates the accounts for Doctors while the patients create their own accounts. Moreover, each user has a dashboard adapted to the category they belong to, that is the Doctor, Administrator and the Patient categories have different dashboards.

The URL http://localhost/hospital/hospital/ redirects to the HMS landing. From the landing page, each user takes a different path based on the category and privilege.

The Patient

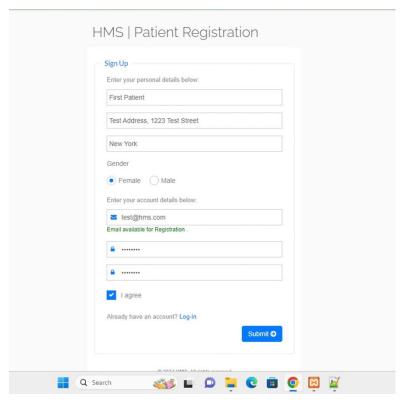

How to Login:

- 1. In the Logins section, click on the Click Here button in the Patient Login section.
- 2. In the Patient Login page, enter the email address and password
- 3. Click on the Login button

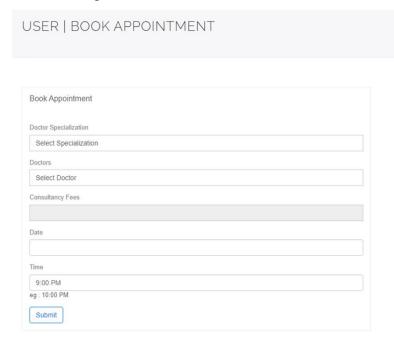

How to Sign up:

- 1. In the Logins section, click on the Click Here button in the Patient Login section.
- 2. On the Patient Login page, click on the text "Create an account"
- 3. Fill in the required details and click on the Submit button

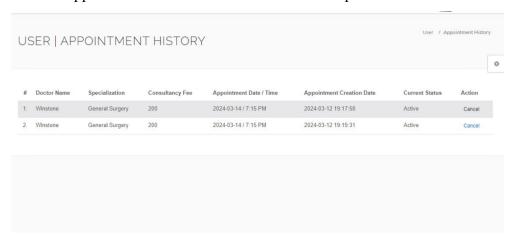

How to Make Appointments.

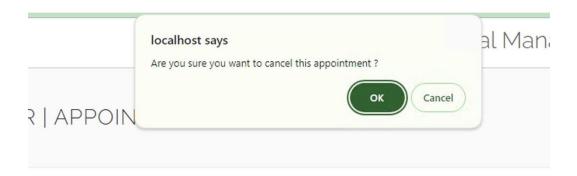

- 1. In the Patient Dashboard, select Book Appointment in the Menu on the Left
- 2. Fill in the required details then select submit.

Cancel Appointment:

- 1. To cancel appoint, navigate to the Appointment History option in the Menu on the Left
- 2. In the Appointments listed click on the Cancel option on the right end of the chosen appointment.
- 3. Choose OK option in the alert that appears on top of the page.
- 4. An alert appears in Red to show the success fo the operation.

tor Name	Specialization	Consultancy Fee	Appointment Date / Time	Appointme
stone	General Surgery	200	2024-03-14 / 7:15 PM	2024-03-12
stone	General Surgery	200	2024-03-14 / 7:15 PM	2024-03-12

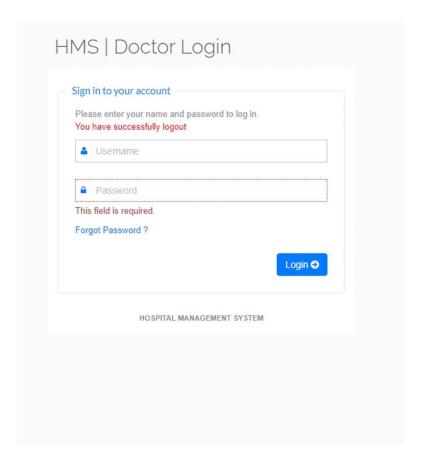

Your appointment canceled !!

Doctor Name	Specialization	Consultanc
Winstone	General Surgery	200
Winstone	General Surgery	200
	Winstone	Winstone General Surgery

The Doctor

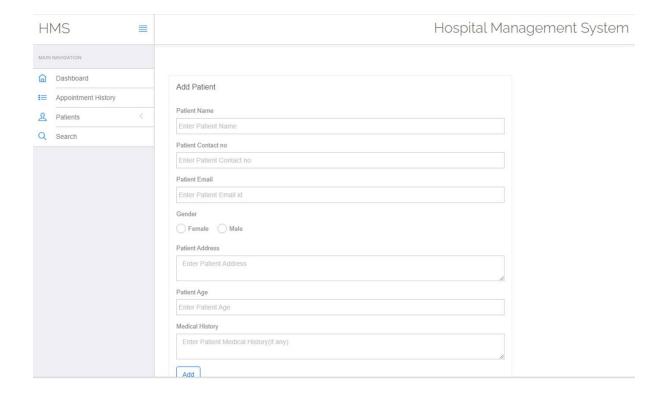

How to Login:

- 1. In the Logins section, click on the Click Here button in the Doctors Login section.
- 2. In the Doctors Login page, enter the email address and password
- 3. Click on the Login button

How to Add Patients:

- 1. In the Doctors Dashboard, Add Patient in the Menu on the Left
- 2. Fill in the required details then select Add.

Instructions:

This project was developed and tested using Xampp web server Environment setup and to install the system, follow these steps:

- First, download a PHP-enabled web server such as Xampp from the given link.
 https://www.apachefriends.org/download.html click on next on all the pop-ups and then click on finish.
- 2. Then open the Xampp and Ensure the Apache server and SQL server runs by clicking on start.
- 3. Clone the code from github and copy the Source code Phase1 folder.
- 4. Then in local disk C open xampp then navigate to htdocs then paste the Source Code Phase1 folder in htdocs.
- 5. Now click on Admin on MySQL in Xampp then it will redirect to phpMyAdmin then create a new database hms by clicking on New.
- 6. Then open database hms that you have created and import the hms.sql file which is present in backend folder in Source_Code_Phase1 (Path: Source_Code_Phase1/Backend).
- 7. Now open Xampp and click Admin on Apache or Mysql then enter this URL http://localhost/Source Code Phase1 to run the project.

Peer Review:

At the start of this Deliverable we have inititated a group meeting to discuss on the development phase 1 functionalities. Here we decided to go with PHP because of it's better performance and good interface to our project. As PHP is a fast executed language with webserver Apache. As we were also using the same webserver So, we decided to use PHP and for Database we have used the mysql. As our all team members were know the basics of PHP but we could be able to learn and implement as it is easy to grab quickly. During this meeting all team members were assigned with tasks on different functionalities development.

Then, We had another meeting to go through the progress of the work that we have assigned during our first meeting. Then we have gone through the loop wholes that are effecting our coding standards and the database structures. Then we thought of some ways to implement the code to meet the standards.

During our last meeting we have planned to see the efficiency and working of the code to make sure that all test cases are passed. As far we have developed the functionalities of phase 1.

Reflections:

What has been accomplished:

We have developed the functionalities of our development phase - 1 which we have mentioned in deliverable 2.

What went well:

Team coordination and support. Everyone supported and involved in learning PHP and using it to develop initial phase of our project.

What could be improved:

There is some miscommunication happened in our understandings. We need to improve that in order to have good implementation.

Member Contribution Table:

Member Name	Contribution	Overall	Note: if applicable
	Description	Contribution(%)	
Anusha	Worked on	100%	
	development of front		
	- end interface of		
	patient, doctor and		
	admin. And could be		
	able to integrate		
	different code		
	functionality		
	modules in to single		
	application. I wrote		
	Requirements as part		
	of the report.		
Vishwitha	Worked on	100%	
	development of Back		
	- end for patient,		
	doctor and admin		
	portals. And have		
	done data binding of		
	front end portals with		
	back end. I wrote		
	testcases as part of		
	the report.		
Dinesh	Worked on front end	100%	
	dashboards of		
	patient, doctor and		
	also appointment		
	scheduling interface.		
	I have drawn usecase		

	normal and error		
	case diagrams.		
Deepak	Worked on front end,	100%	
	back end for admin		
	portal. Have created		
	dashboard for admin		
	and doctor session		
	and user session logs.		
	I wrote Reflections,		
	peer review as part of		
	the report.		
Divya Anusha	Worked on	100%	
	implementing the		
	search functionality		
	for both admin and		
	doctor portals. I have		
	drawn sequence		
	diagram as part of the		
	report.		
Pavan	Worked on patient	100%	
	profile database and		
	appointment		
	database		
	management. I wrote		
	User manual and		
	instructions as part of		
	the report.		
Jaswanth	Worked on front end	100%	
	interface of reports		
	and pages and		
	contact queries of the		
	admin portal.		
	Worked on		

	connecting the		
	contact queries with		
	backend		
	communication. I		
	wrote introduction as		
	part of the report.		
Tejaswi	Worked on front end	100%	
	interface of home		
	page which includes		
	services which we		
	are offering and		
	description on about		
	us and I have drawn		
	class diagram as part		
	of the report.
